CORN GRAIN VARIETY TESTS IN TENNESSEE

AGRESEARCH AND EDUCATION CENTER TESTS

2013

Experimental Procedures:

AgResearch and Education Center Tests: All corn hybrid trials were conducted in each of the physiographic regions of the state. Tests were conducted at the Ames Plantation (Grand Junction), Highland Rim (Springfield), East TN (Knoxville), and Milan (Milan) AgResearch and Education Centers (**REC**). The Early and Medium-season tests were also planted at the Agricenter International Research Center (Memphis). **Duplicate plantings** of the early-, medium- and full-season tests were made at the **Milan and Highland Rim AgResearch and Education Centers** for performance testing **with and without irrigation**.

The corn hybrids were placed in either the **early-, medium-, or full-season tests** based on the maturity as reported by the company providing the hybrid. The early season test contained hybrids that had maturity <114 days after planting (DAP); the medium season test contained hybrids with maturity of 114-116 DAP; and the full season test contained hybrids with maturities >116 DAP. All corn hybrid trials were planted to uniform populations per acre at each location using a precision seeding planter. Population goals of 32,000 plants per acre for irrigated plots and 30,000 plants per acre for non-irrigated plots were attempted at all locations. Populations varied with location but attempts were made to make the population the same for all hybrids at a given location (Table 1). Tests were conducted using 30 inch row spacing. The tests were fertilized with 150 pounds of nitrogen per acre. A portion of the nitrogen was applied prior to seeding and the remainder was applied as a side-dress. The plot size was two rows, 30 feet in length. Plots were replicated three times at each location. An incomplete block design was used at each location in order to reduce the within replication variation.

County Standard Tests: The County Standard Corn Tests were conducted in 25 counties in Tennessee, and four counties in Western Kentucky. The number of counties depended on the test. The County Standard Tests were divided into **early-, medium-, and full-season glyphosate resistant (RR) and stacked trait tests** (same DAP criteria as listed above; some entries were stacked with Bt resistance genes). Each hybrid was evaluated in a large strip-plot at each location, thus **each county test was considered as one replication of the test** in calculating the overall average yield and in conducting the statistical analysis to determine significant differences. At each location, plots were planted, sprayed, fertilized, and harvested with the equipment used in the cooperating producer's farming operation. The width and length of strip-plots were different in each county; however, within a location in a county, the strips were trimmed on the ends so that the lengths were the same for each variety, or if the lengths were different then the harvested length was measured for each variety and appropriate harvested area adjustments were made to determine the yield per acre.

Growing Season: The 2013 growing season was characterized by a cool, wet spring which delayed planting and mandated replanting in some flood-prone areas. By mid-May, planting was around two weeks behind the five-year average. Wet conditions throughout the summer were favorable for growth with eighty-seven percent of the crop rated good to excellent in mid-August. Although corn harvest was delayed compared to last year and the five year average, yields were reported as well above average. By the end of October, 84% of corn for grain had been harvested. According to the Tennessee Agricultural Statistics Service, producers planted 900,000 acres this year, a decrease of 130,000 from 2012 and harvested 835,000 acres, down 125,000 acres from last season. Corn grain production for 2013 is projected to be 130.3 million bushels, an increase of 60 percent from the previous year.

Interpretation of Data:

The tables on the following pages have been prepared with the entries listed in order of overall average performance across locations, the highest-yielding entry being listed first. **All yields presented have been adjusted to 15.5% moisture.** At the bottom of the tables, **LSD** values stand for **Least Significant Difference**. The mean yields of any two varieties being compared must differ by at least the amount shown to be considered different in yielding ability at the 5% level of probability of significance. For example, given that the LSD for a test is 8.0 bu/a and the mean yield of Hybrid A was 110 bu/a and the mean yield of Hybrid B was 115 bu/a, then the two hybrids are not statistically different in yield because the difference of 5 bu/a is less than the minimum of 8 bu/a required for them to be significant. Similarly, if the average yield of Hybrid C was 123 bu/a then it is significantly higher yielding than both Hybrid B ($123 - 115 = 8$ bu/a = LSD of 8) and Hybrid A ($123 - 110 = 13$ bu/a > LSD of 8).

The **coefficient of variation (C.V.)** values are shown at the bottom of each table. This value is a measure of the error variability found within each experiment. It is the percentage that the square root of error variance is of the overall test mean yield at that location. For example, a C.V. of 10% indicates that the size of the error variation is about 10% of the size of the test mean. Similarly, a C.V. of 30% indicates that the size of the error variation is nearly one-third as large as the test mean. A goal in conducting each yield test is to keep the C.V. as low as possible, preferably below 20 percent.

RESULTS

Yield and Agronomic Traits. One hundred and nine corn hybrids were evaluated in the 2013 AgResearch and Education Center (REC) tests in Tennessee. There were 49 hybrids in the early- (Tables 2-7), 43 in the medium- (Tables 8-13), and 17 hybrids in the full-season (Tables 14-19). The 109 hybrids represent 18 different brands (Table 26). The **County Standard Tests (CST)** consisted of a early-season glyphosate resistant and stacked trait test (22 hybrids at 19 locations, Table 20), a medium-season glyphosate resistant and stacked trait test (18 hybrids at 19 locations, Table 21), and a full-season glyphosate resistant and stacked trait test (12 hybrids at 12 locations, Table 22) for a total of 52 hybrids. In addition to Tennessee counties, the County Standard Tests involved Ballard, Carlisle, McCracken, and Fulton counties in Western Kentucky. Common to both the REC and CST tests were 21 early-season, 15 medium-season, and nine full-season hybrids (Tables 23-25). Similar to the REC tests, in the CST all hybrids were placed in the maturity test for which they fit regardless of other traits associated with each entry.

One hundred three of the 109 hybrids in the 2013 REC tests have a Bt gene for Corn Borer resistance (denoted by Bt, YG, CB, YGCB, HX, VT2, VT3); 54 have a gene for Corn Root Worm resistance (denoted by RW, VT3); 106 have a Roundup Ready gene for tolerance to glyphosate herbicide (denoted by R, RR, RR2, GT); 43 have a gene for tolerance to Liberty (glufosinate) herbicide (denoted by LL); five hybrids are conventional and contain no transgenes; three hybrids contain a single transgene; 102 are stacked with combinations of RR, Bt, RW, LL. **VT2P, VT2Pro or PRO2** designation denotes resistance to glyphosate, corn borer, earworm and armyworm. **VT3P, VT3Pro or PRO3** designation denotes resistance to glyphosate, corn borer (CB), rootworm (RW), earworm (EW) and armyworm (AW). **VIP or Viptera** designation denotes resistance to corn earworm, black cutworm, western bean cutworm, dingy cutworm and stalk borers. The newest designation is **SSX** or **SmartStax**. The **SSX** indicates that the hybrid has RW (2), EW, AW, CB insect resistance genes plus RR2 and LL herbicide tolerance genes for a total of 7 genes stacked.

Irrigated vs. Non-irrigated Yields. Duplicate tests were conducted at the Milan and Highland Rim AgResearch and Education Centers with and without irrigation. In a year of adequate rainfall and warm temperatures during critical stages of the growing season, the average differences in yields across hybrids receiving irrigation versus non-irrigation at Milan were small: 3 bu/a for early-season hybrids (Table 2), 5 bu/a for medium-season hybrids (Table 8), and 14 bu/a for full-season hybrids (Table 14). Similarly at Highland Rim average differences in yields across hybrids receiving irrigation versus non-irrigation were small; 8 bu/a for early-season hybrids (Table 4), but showed greater differences in the medium and full-season hybrids, 24 bu/a for medium-season hybrids (Table 11), and 28 bu/a for full-season hybrids (Table 14). At Highland Rim, non-irrigated plot averages were higher for than irrigated plot averages in the medium and full tests. **Some of the difference in the full-season test at Highland Rim is likely due to the late re-planting (May 29) of the irrigated test.**

Table 1. Location information from AgResearch and Education Centers where the corn hybrid tests were conducted in Tennessee in 2013.

§ If a trait appears inside parenthesis i.e. (RR/CB), then it is not part of the hybrid name.

Bt, YG, YGCB, CB, HX = contains a *Bacillus thuringiensis* gene for insect resistance

YGRW, RW, CRW = contains a gene for rootworm resistance

R, RR, RR2, R2, GT = contains a gene for tolerance to glyphosate

VT3 = contains genes for European corn borer, corn root worm, and glyphosate resistance

VT3P, PRO = contains genes for corn borer, rootworm, earworm, armyworm and glyphosate resistance

CL = contains a gene for tolerance to Imidazolinone class herbicides

LL = contains a gene for tolerance to glufosinate

SSX = SmartStax = RW (2), EW, AW, CB, RR2 and LL

Protein, Oil, and Starch on a dry weight basis

[†]All Yields are adjusted to 15.5% moisture.

[‡]Average of Knoxville and Springfield.

§ If a trait appears inside parenthesis i.e. (RR/CB), then it is not part of the hybrid name.

Bt, YG, YGCB, CB, HX = contains a *Bacillus thuringiensis* gene for insect resistance

YGRW, RW, CRW = contains a gene for rootworm resistance

R, RR, RR2, R2, GT = contains a gene for tolerance to glyphosate

VT3 = contains genes for European corn borer, corn root worm, and glyphosate resistance

VT3P, PRO = contains genes for corn borer, rootworm, earworm, armyworm and glyphosate resistance

CL = contains a gene for tolerance to Imidazolinone class herbicides

LL = contains a gene for tolerance to glufosinate

W = white grain

† All Yields are adjusted to 15.5% moisture.

§ Planting date. %M= Avg. % moisture at harvest across all locations.

†Yields have been adjusted to 15.5% moisture. Each hybrid was evaluated in a large strip-plot at each location, thus each county test was considered as one replication of the test in calculating the average yield and in conducting the statistical analysis to determine significant differences (MS).

¶= Avg. Test Wt. lbs/bu @ 16 locations.

MS= Hybrids that have any MS letter in common are not significantly different in yield at the 5% level of probability.

Hybrids marked with an asterisk (*), and/or (**), were in the top performing group in 2012 and/or 2011, respectively.

Locations include; *Ballard, KY, Carlisle, KY, Carroll, Coffee, Dyer, Fayette irrigated, Franklin, Fulton, KY, Gibson, Giles, Henry 1 (Brannon Farms), Henry 2 (Tosh Farms), Loudon, Madison, Montgomery, Obion irrigated, Robertson, Weakley 1 (Grooms) & Weakley 2 (Oliver)*.

‡Data provided by Robert C. Williams, Ext. Area Specialist, Grain Crops, and extension agents in counties shown above.

§ Planting date. %M= Avg. % moisture at harvest across all locations.

¶Yields have been adjusted to 15.5% moisture. Each hybrid was evaluated in a large strip-plot at each location, thus each county test was considered as one replication of the test in calculating the average yield and in conducting the statistical analysis to determine significant differences (MS).

¶= Avg. Test Wt. lbs/bu @ 16 locations.

MS= Hybrids that have any MS letter in common are not significantly different in yield at the 5% level of probability.

Hybrids marked with an asterisk (*), (**) and/or (***) were in the top performing group in 2012, 2011 and 2010.

Locations include; *Calloway, KY, Cannon, Carlisle, KY, Coffee, Decatur, Dyer, Fayette 1 (Ames), Fayette 2 (McNabb), Franklin, Fulton, KY, Gibson, Giles, Haywood, Henderson,*

Henry 1 (Brannon), Henry 2 (Tosh), Hickman, Madison, McCracken KY, Perry, Robertson, Shelby and Wayne.

†Data provided by Robert C. Williams, Ext. Area Specialist, Grain Crops, and extension agents in counties shown above.

†All Yields are adjusted to 15.5% moisture.

§ If a trait appears inside parenthesis i.e. (RR/CB), then it is not part of the hybrid name.

Bt, YG, YGCB, CB, HX = contains a *Bacillus thuringiensis* gene for insect resistance

YGRW, RW, CRW = contains a gene for rootworm resistance

VIP = Viptera, contains a gene for resistance to corn earworm, black cutworm, western bean cutworm, dingy cutworm, and stalk borers.

RIB = Refuge In Bag, contains a percentage of non BT protected corn in order to conform to insect refuge regulations.

R, RR, RR2, R2, GT = contains a gene for tolerance to glyphosate

LL = contains a gene for tolerance to glufosinate

VT2P, VT2Pro, PRO2 = contains genes for corn borer, earworm, armyworm and glyphosate resistance

VT3 = contains genes for European corn borer, corn root worm, and glyphosate resistance

VT3P, VT3Pro, PRO3 = contains genes for corn borer, rootworm, earworm, armyworm and glyphosate resistance

SSX = SmartStax = RW (2), EW, AW, CB, RR2 and LL

Bt, YG, YGCB, CB, HX = contains a *Bacillus thuringiensis* gene for insect resistance

YGRW, RW, CRW = contains a gene for rootworm resistance

VIP = Viptera, contains a gene for resistance to corn earworm, black cutworm, western bean cutworm, dingy cutworm, and stalk borers.

RIB = Refuge In Bag, contains a percentage of non BT protected corn in order to conform to insect refuge regulations.

R, RR, RR2, R2, GT = contains a gene for tolerance to glyphosate

LL = contains a gene for tolerance to glufosinate

VT2P, VT2Pro, PRO2 = contains genes for corn borer, earworm, armyworm and glyphosate resistance

VT3 = contains genes for European corn borer, corn root worm, and glyphosate resistance

VT3P, VT3Pro, PRO3 = contains genes for corn borer, rootworm, earworm, armyworm and glyphosate resistance

Table 26. Characteristics, as described by the seed company, of corn hybrids evaluated in yield tests in Tennessee during 2013†

§ If a trait appears inside parenthesis i.e. (RR/CB), then it is not part of the hybrid name.

VT3 = contains genes for European corn borer, corn root worm, and glyphosate resistance

Bt, YG, YGCB, CB, HX = contains a *Bacillus thuringiensis* gene for insect resistance

RR, R, R2, RR2, GT = contains a gene for tolerance to glyphosate

LL = contains a gene for tolerance to glufosinate

W = white grain

CL = contains a gene for tolerance to Imidazolinone class herbicides

VT3P = contains genes for corn borer, rootworm, earworm, armyworm and glyphosate resistance

CBRW, RW, CRW = contains a gene for rootworm resistance

† Information on this table provided by the respective seed companies.
